

# Trapped mode analysis for the PETRA-4 IVUs

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

Frederik Quetscher, Erion Gjonaj, Herbert De Gersem

# Problem Description

- Task
  - Identification of modes, resonance frequencies and quality factors
- Creation of an accurate and efficient model
- Measurement of S-parameters as reference
- Work in progress

# Content

- Problem Description
- Geometry
- Eigenmode Analysis
- Q-Factors
- Comparison with Measurement
- Periodic Model
- Conclusion

# Geometry

## Original CAD model

# Geometry

## Periodic magnet structure

NdFeB  
 $\sigma = 0.7e6 \text{ S/m}$   
 $\mu_r = 1$

Copper / nickel

CoFeV  
 $\sigma = 2e6 \text{ S/m}$   
 $\mu_r = 18000$

# Content

- Problem Description
- Geometry
- **Eigenmode Analysis**
- Q-Factors
- Comparison with Measurement
- Periodic Model
- Conclusion

# Eigenmode Analysis

## Simulation procedure

- Eigenmode solver in 3D
  - Efficient
- S-parameter simulation
  - Confirm eigenmode solution

# Eigenmode Analysis

## Field distribution

- Ground mode at 234MHz, gap=40mm
- Strong field in the „plate capacitor“
- Significant field concentration between the pillars

# Eigenmode Analysis

## Mesh convergence

- Eigenmode solver
- Ground mode, **gap=5mm**
- #tets=20k...2M
- **≈0.5% error** at 15 cells per wavelength

# Eigenmode Analysis

## Mesh convergence

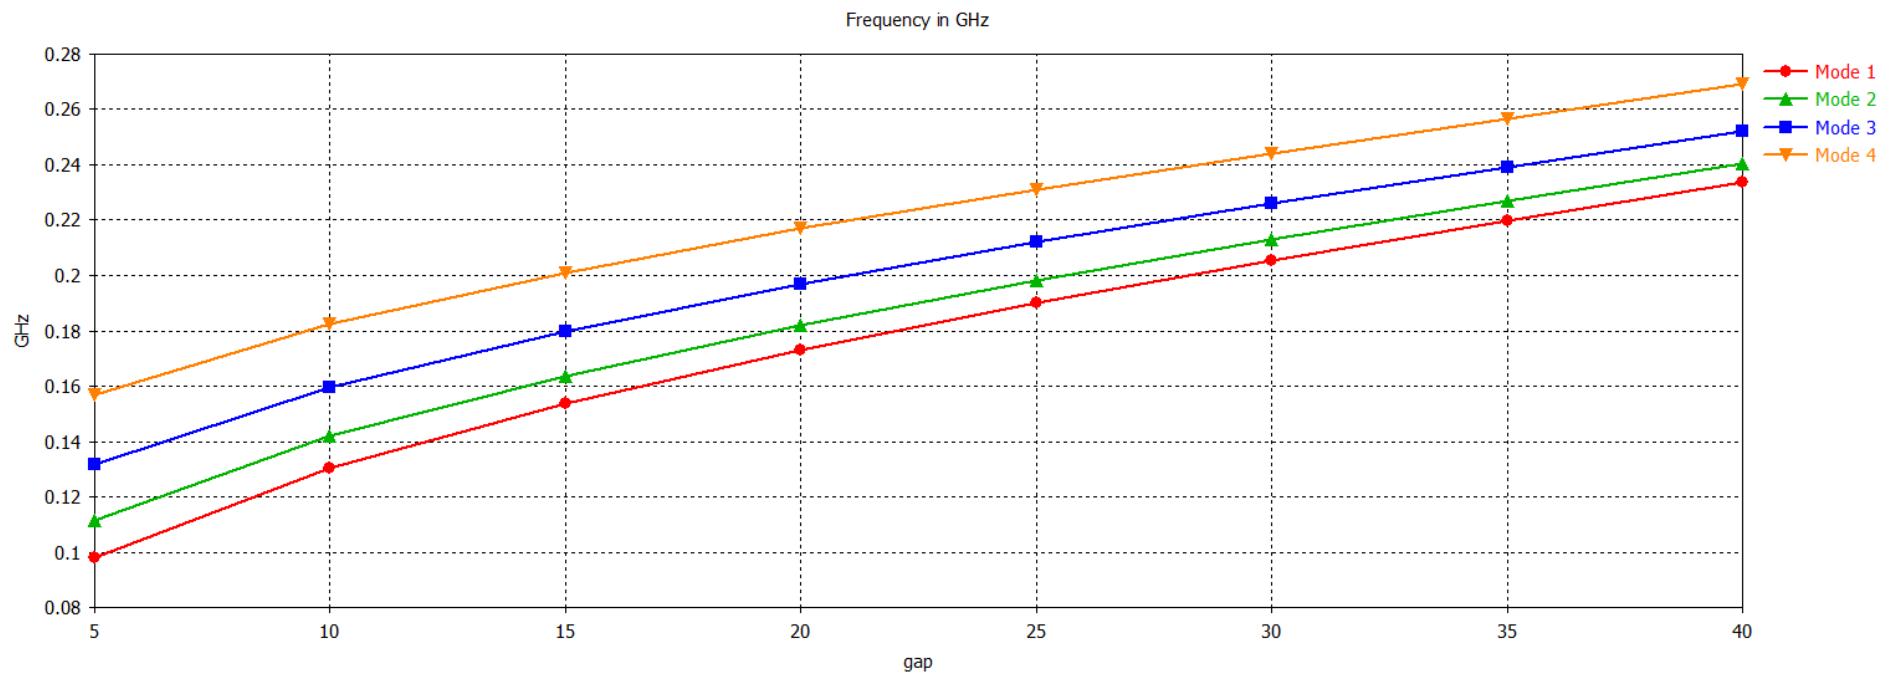

- Eigenmode solver
- Ground mode, **gap=40mm**
- #tets=20k...2M
- **≈0.2% error** at 15 cells per wavelength

# Eigenmode Analysis

## Gap sweep

- Resonance frequencies rising monotonously

# Eigenmode Analysis

## S-parameter simulation

- Perfect agreement with eigenvalue solver (error < 1%)

Resonance frequencies of ground mode

Gap	5mm	40mm
Eigen.	98.2MHz	233.9MHz
Driven	98.6MHz	234.3MHz

# Q-Factors

- Gap=5mm
- Ground mode
- Eigenmode solution
  - Power-loss method
  - $Q_0=2300$
- Frequency driven
  - Lossy metals (surface impedance)
  - $Q_L=600$
  - $Q_0=2400$ 
    - Same for different coupler / antennas
- Good agreement

Calculation of  $Q_0$  in the  
overcoupled case

$$\beta_1 = \frac{1+|S_{11}|}{1-|S_{11}|}, \quad \beta_2 = \frac{|S_{21}|^2}{1-|S_{11}|^2-|S_{21}|^2}$$

$$Q_0 = Q_L(1 + \beta_1 + \beta_2)$$

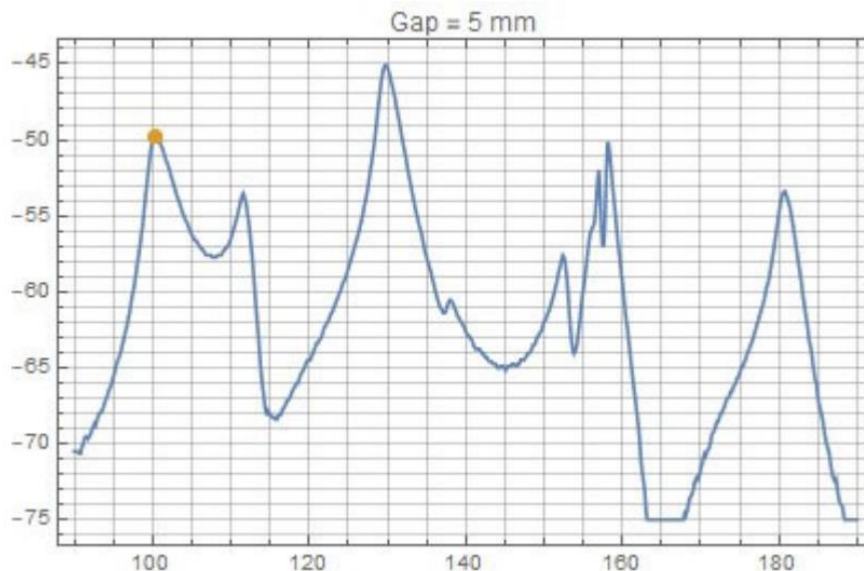

# Content

- Problem Description
- Geometry
- Eigenmode Analysis
- Q-Factors
- **Comparison with Measurement**
- Periodic Model
- Conclusion

# Comparison with Measurement

## Setup

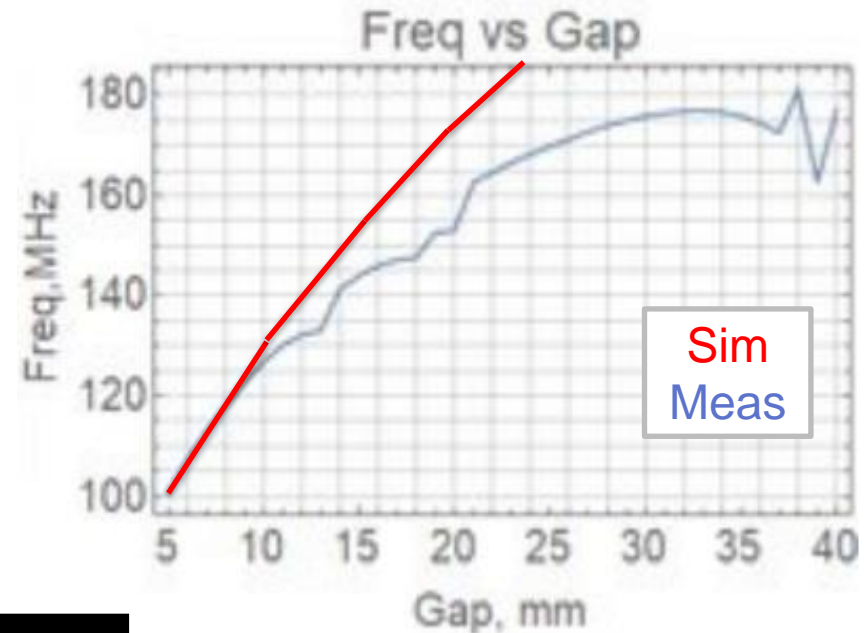

- Measurement from M. Ebert, P. Fuchs, P. Vagin, A. Schoeps (16.12.18)

# Comparison with Measurement

## Resonance frequency

- Ground mode
- Good agreement at small gaps
- Larger error at large gaps

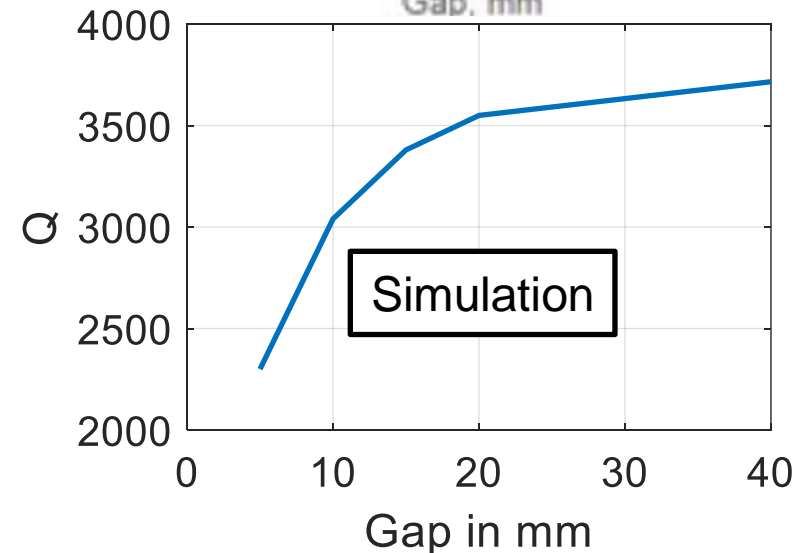

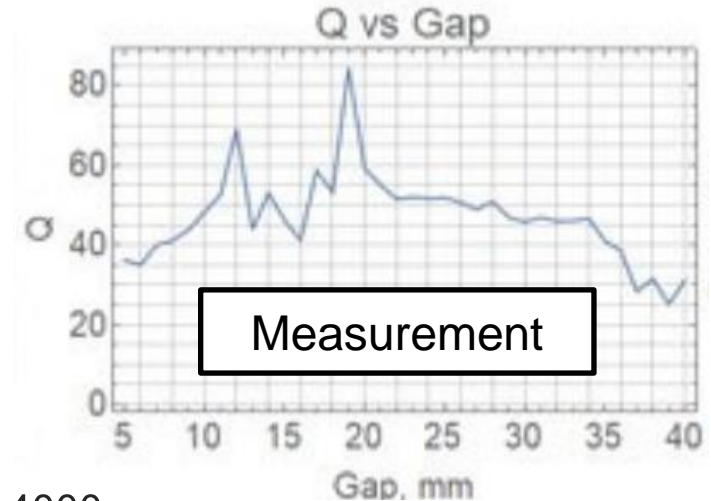

Resonance frequencies of ground mode in MHz

Gap	5mm	25mm	40mm
Measurement	100	170	177
Simulation	99	190	234
Relative error	1%	12%	32%

# Comparison with Measurement

## Q-factor comparison

- Large discrepancy
- Measurement setup?
  - Assumption: measured Q is  $Q_L$
  - In simulation  $Q_L > 600$
- Material parameters?
  - NdFeB magnets + CoFeV
  - Mostly covered by the copper foil
- Ferrite dampers installed?

# Content

- Problem Description
- Geometry
- Eigenmode Analysis
- Q-Factors
- Comparison with Measurement
- **Periodic Model**
- Conclusion

# Periodic Model

## Geometry

# Periodic Model

## Surface current, losses

- $Q=2900$

	Losses
Steel	70%
Aluminum	22%
CoFeV	5%
NdFeB	3%
Copper	0.2%

# Conclusion

- Detailed model for PETRA-4 IVU's trapped mode analysis
- Resonance frequencies
  - Good agreement at smaller gaps
  - **Worse agreement at larger gaps**
- Quality factor
  - **No agreement**
  - **Similar result for the SLAC-IVUs, PRAB 2019**
- Open questions regarding the model
  - Material properties?
  - Ferrite dampers?
  - New experiments?
